The invention relates to an isolated cytokine receptor polypeptide dealgnated Ecytori8. The Ecytori8 polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit excell proliferation associated with psorialsis or tumour growth. The encoding nucleic acids are useful for providing Ecytoria in vivo by gene therapy techniques. Ecytoria oligonacieotide probes are useful for in vivo diagnosis, and the Ecytoria probes and primers can be used to detect and localize Ecytoria gross aberrations. In compose are also useful for a cletching gross aberrations, is changed in which ecytoria gross aberrations is changed in which inkage-based testing of pulmonary alveolar proteinosis, familial pariodic fever and erythroleukemia. and erythroleukemia associated with polymorphisms of cytokine receptors. The present sequence represents a human Ecytoria amino acid sequence. and modulating immune system by binding to endogenous zcytor18; DNLPQLCSHLHSRDHGLQEPGQHTRQGSRRNYFRSKSGRSLYVAICNMHQFIDEEPDWFE 540 121 RIGNESOPFLNMKFETDYFVKVVPFPSIKNESNYHPFFFRTRACDILLLQPDNLACKPFWK 180 PRNINISOHGSDMOVSFDHAPHNFGFRFFYLHYKLKHEGPFRRKTCKQEQTTETTSCLLQ. 240 241 NVSPGDYIIELVDDTNTTRKVMHYALKPVHSPWAGPIRAVAITVPLVVISAFATLFTVMC 300 301 RKKQQENIYSHLDEESSESSTYTAALPRERLRPRPKVFLCYSSKDGQNHMNVVQCFAYFL 360 RGSGKGELFLVAVSAIAEKLRQAKQSSSAALSKFIAVYFDYSCEGDVPGILDLSTKYRLM 480 100.0%; Score 3829; DB 23; Length.753; 100.0%; Pred. The invention relates to an isolated cytokine receptor polypeptide designated Zcytori8. The Zcytori8 polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit cell proliferation associated with positasis or tumour growth. The encoding nucleic acids are useful for providing Zcytori8 in vivo by gene therapy techniques. Zcytori8 oligonucleotide probes are useful for invivo diagnosis, and the Zcytori8 probes and primers can be used to detect and localize Zcytori8 gross aberrations in chromosome. In which Ecytori8 gene resides: The Zcytori8 probes are maples. The probes are also useful for detecting gross aberrations in chromosome. In which Ecytori8 gene resides: The Zcytori8 polyuciectides can also be used in linkage-based testing of pulmonary alveolar proteinosis, familial periodic fever and erythroleukemia, and erythroleukemia associated with holymorphisms of cytokine receptors: The present sequence represents a human Zcytori8 variant amino acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention relates to an isolated cytokine receptor polypeptide designated. Exptor18. The Exptor18 polypeptides.can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit cell. Proliferation associated with psorlasis or tumour growth. The encoding nucleic acids are useful for providing Exptor18 in vivo by gene therapy, techniques: "Exptor18 injonucleotide. probes are useful for in vivo diagnosis, and the Exptor18 probes and primers can be used for in vivo diagnosis, and the Exptor18 probes and primers can be used to detect and localize Exptor18 gene: expression: in: titissue samples. The probes are also useful for detecting gross aberrations in chromosome 3 in which Exptor18 gene resides. The Exptor18 polyuncleotides can also be used in linkage-based testing of pulmonary: alveolar proteinosis, familial periodic fever and erythroleukemia; and erythroleukemia associated with holymorphisms of cytokine receptors. The present sequence represents a human Exytor18 splice variant.
                                                                                                      New cytokine receptor polypeptide designated zcytori8, useful for inhibiting cell proliferation associated with psoriasis or tumor growth, and modulating immune system by binding to endogenous zcytori8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TISQYACHDQVAVTILWSPGALGIEFLKGFRVILEELKSEGRQCQQLILKDPKQLNSSFK 120

useful for preventing, diagnosing diabetes, psoriasis and glaucoma

The invention describes novel nucleic acids encoding interleukin (IL) 17

receptor like polypeptides useful as vaccines and in gene therapy. These have Immunomodulatory, anti-infammatory, anti-diabetic, anti-infamilation of the immunosuppressive, hepatic, anabolic, anti-infamilation in the immunosuppressive, hepatic, anti-infamilation, dermatological, anti-infamilation, vascular, cytostatic, anti-infamilation, dermatological, or stepathic, vascular, cytostatic, anti-infamilation anti-infamilation in the interpretible or protein may be used to prevent and treat diseases associated with chotosin may be used to prevent and treat diseases associated with chotosin may be used to prevent and treat diseases associated with chotosin may be used to prevent and treat diseases associated with chotosin may be used to prevent and treat diseases associated with chotosin, infections (e.g. hepatitis and septicaemia), will dispertable in the fermination of the interpretible of constant and observed in the disperse and epilepsy), usefunction (e.g. Alzheimer's disease, parkinson's disease and epilepsy), ung disorders (e.g. osteoporosis and hypercalcaemia), vascular disorders (e.g. stroke and atherosclerosis, cancers (e.g. infermination meuropathy). The brast cancers, reproductive disorders (e.g. infermination neuropathy). The DNA and its complements may also used as diagnostic probes to detect and quantitate the presence of similar nucleic acids in samples and identify modulators of expression and activity. The sasays to identify modulators of expression and activity. The sasays to identify modulators of expression and activity. The 2; Page 152-154; 158pp; English. Claim

The invention describes novel nucleic acids encoding interleutin (IL) 17 receptor like polypeptides useful as vaccines and in gene therapy. These contemporary anti-diabetic, anti-microbial, immunosuppressive, hepatic, anability, anti-diabetic, anti-microbial, immunosuppressive, hepatic, anability, and extil-prakinsonian, anti-convulsant, anti-leakemic, anti-microbial, osteopathic, vascular, cytostatic, anti-leakemic, anti-microbial, osteopathic, vascular, cytostatic, anti-leakemic, anti-microbial, osteopathic, vascular, cytostatic, anti-leakemic, anti-microbial, and ophthalmological activities. The IL-17 receptor like nucleic acids and proteins may be used to prevent and treat disease associated with claspropriate IL-17 receptor like polypeptide (ILI/TIP) expression. These include, for example immune discoders (e.g. inflammation, diabetes and transplant, rejection), infections (e.g. inflammation, diabetes and transplant, rejection), infections (e.g. inflammation, spincalarial, wight, discoders (e.g. acytic fibrosis, asthma and emphysema), skin disease (e.g. acytic fibrosis, asthma and emphysema), skin disease (e.g. stroke, and atherosclerosis and hypercalcaemia, welcome and breast cancer), reproductive discoders (e.g. infertinity and midgen in the productive discoders (e.g. infertinity and midgen in the productive therapy. The ILI/Tip may also be used as antigens in the production of antibodies against the proteins and in assays to identify modulators of smillar and activity. The antigens in the production of antibodies against the proteins and in assays to identify modulators of antibodies against the proteins and in assays to identify modulators of antibodies against the proteins and in antigens and antagonists may also be used as antigens in the production of antibodies against the proteins and in a surfactivity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   expression and activity.
Note: This sequence is not given in the specification but is based on the human Interleukin 17 (IL-17) receptor like protein sequence (AAU09904) and has been created according to information given in claim 20.
                                anticonvulsanti anti-asthmatic; dermatological; renal; gateopathic; vascular; cytostatic; anti-leukaemic; anti-infertility; ophthalmological;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids encoding interleukin 17 receptor like polypeptides, useful for preventing, diagnosing and treating, e.g. leukemia, asthma, diabetes, psoriasis and glaucoma

The invention describes novel nucleic acids encoding interleukin (IL) 17 receptor. Itse polypeptides useful as vaccines and in gene therapy. These have immunosuppressive, ment-inflammatory, anti-dabetic anti-altelmer's, renal, anti-parkinsoilan, anti-incolan, anti-infertility and osteopithic, anti-incolar, anti-infertility and propting before and treat diseases associated with a population and before and proteins and before and proteins and before and anti-incolar, and anti-incolar, patients needing restorative therapy. The ILI/Trip may also be used as antigens in the production of antibodies against the proteins and in assays to identify modulators of expression and activity. The anti-ILI/Trip antibodies and antagonists may also be used to down regulate expression and activity. Note: This sequence is not given in the specification but is based on thuman interleukin i? (IL-17) receptor like protein sequence (AAU09904) and has been created according to information given in claim 18. receptor like polypeptides, asthma, treating, e.g. leukemia, asthma, asthma, we have been asthma. Claim 18 : Page - : 158pp : English Nucleic acids encoding interleukin 17 useful for preventing, diagnosing and diabetes, psoriasis and glaucomante (1) 表 1 元 二 元 元

The invention describes novel nucleic acids encoding interleukin (IL) 17 receptor like polypeptides useful as vaccines and in gene therapy. These have immunomodulatory, anti-inflammatory, anti-diabetic, anti-microbial, immunosuppressive, hepatic, anabolic, anti-dischemer's, renal, anti-parkinsonian, anti-convulsant, anti-asthmatic, dermatological, osteopathic, vascular, cytostatic, anti-leukaemic, anti-infertility and ophthalmological activities. The IL-17 receptor like nucleic acids and proteins may be used to prevent and treat diseases associated with

Claim 23; Page -; 158pp; English.

The invention describes novel nucleic acids encoding interleukin (IL) 17 receptor like polypeptides useful as vaccines and in gene therapy. These have immunoadulatory, anti-inflammatory, described in optibal activities. The In-inflammatory anti-inflammatory, anti-inflammatory, anti-inflammatory, anti-inflammatory, anti-inflammatory, anti-inflammatory, and propriate IL-IT receptor like polypeptide (IL)Tip) expression. These include, for example immune disorders (e.g. inflammation, disbetes and transplant rejection), infections (e.g. inflammation, disbetes and transplant rejection), infections (e.g. inflammation, disbetes and carried disorders (e.g. anorexia, cachexia and obesity), neuronal disorders (e.g. anorexia, asthma and emphysema), skin disease (e.g. eczema and psordasis), kidney disease (e.g. glomerulonephritis), bone diseases (e.g. stroke and atherosclerosis, and hypercaloammatory), reproductive disorders (e.g. infertility and brancer), reproductive disorders (e.g. infertility and used as ্রউউর breast cancer), reproductive disorders (e.g. infertility and miscarriage), eye disorders (e.g. glaucoma and retinal neuropathy). The DNA and its complements may also used as diagnostic probes to defect and quantitate the presence of similar nucleic acids in samples and identify patients needing restorative therapy. The IL17rip may also be used as

The invention describes novel nucleic acids encoding interleukin (IL) 17

receptor like polypeptides useful as vaccines and in gene therapy. These
have immunomodulatory, anti-inflammatory, anti-diabetic, anti-infercibia,
containmondulatory, enti-inflammatory, anti-diabetic, anti-infercibia,
containmondulatory, enti-inflammatory, anti-diabetic, anti-infertility and
containmondulator, vascular, cytostatic, anti-interment, anti-infertility and
cophthalmological activities. The Li-17 receptor like nucleic acids and
proteins may be used to prevent and treat diseases associated with
cophthalmological activities. The Li-17 receptor like nucleic acids and
proteins may be used to prevent and treat diseases associated with
cinclude, for example immune discorders (e.g. inflammation, disbetes and
transplant rejection), infections (e.g. inflammation) discases (c.g. include, for example immune discorders (e.g. infections) disease, parkinson's disease and epilepsy),
displantion (e.g. cystic-fibrosis, asthma and emphysema), skin disease
(e.g. czema and psoriasis), kidney disease (e.g. glomerulonephritis),
bone diseases (e.g. osteoporosis and hypercalcaemia), vascular disorders
(e.g. stroke and arbanosierosis, andness (e.g. luckerility and
miscarriage), eye disorders (e.g. glaucoma and retinal neuropathy). The
Drast cancer), reproductive dissorders (e.g. luckerility and
miscarriage), eye disorders (e.g. glaucoma and retinal neuropathy). The
Commiscarriage, the presence of similar nucleic acids in samples and deentify
patients needing restorative therapy The III77tp may also be used as
antigens, in the production of antisodies against the proteins and in
antigens, in the production of antisodies against the proteins and in
antigens in the production of expression and activity. The
control of the control of the production of antisodies against the proteins are sequenced and artagonists may also be used to down regulate
Interleuxin 17, hir-if receptor like riotein; immunomodulatory; anti-inflammatory; anti-dispetic; immunomopuppessive; anti-uncrobial; hepatic; anabolic; anofectic; anti-alzhelmer's; anti-parkinsonian; anti-convulsant; anti-asthmatic; dermatological; renal; osteopathic; vascular; optostatic; anti-latemamic; anti-infertility; ophthalmological; hepatitis; anorexis; cachexis; equipment dystunction; lung disease; bone disease; vascular disorder; eye disorder; cancer; human; mutant;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   expression and activity.

Note: This sequence is not given in the specification but is based on thuman interleukin 17 (IL-17) receptor like protein sequence (AAU09904) and has been created according to information given in claim 22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acids encoding interleukin 17 receptor like polypeptides, useful for preventing, diagnosing and treating, e.g. leukemia, asthma,

Nucleic acids encoding interleukin 17 receptor like polypeptides, useful for preventing, diagnosing and treating, e.g. leukemia, asthma, diabetes, psoriasis and glaucoma

Claim 24; Page -; 158pp; English.

The invention describes novel nucleic acids encoding interleukin (IL) 17

receptor like polypeptides useful as vaccines and in gene therapy. These
content of the work in the inflammatory anti-diabetic, anti-microbial,
immunosuppressive, hepatic, anabolic, anti-diabetic, anti-microbial,
anti-parkinsonlan, anti-formulaati, anti-asthmatic, dermatological,
contentation, vascular, cytostatic, anti-leukaemic, anti-inferility and
contemplation of the prevent anti-leukaemic, anti-inferility and
propriate IL-17 receptor like polypeptide (ILI/IL) expression. These
include, for example immune disorders (e.g. inflammation, diabetes and
transplant rejection), infections (e.g. inflammation, diabetes and
transplant rejection), infections (e.g. inflammation, diabetes and
transplant rejection), infections (e.g. inflammation, diabetes
dysfunction (e.g. Alzheimer's disease, parkinson's disease and epilepsy),
undight disorders (e.g. cystic fibrosis, asthma and obesity), neuronal
dysorders (e.g. cystic fibrosis, asthma and emphysema), skin disease
(e.g. stroke and atheroscierosis, cancers (e.g. infertility and
bone diseases (e.g. osteoporosis and hypercalcemia), vascular disorders
(e.g. stroke and atheroscierosis, cancers (e.g. infertility and
brasst cancer), reproductive disorders (e.g. infertility and

contents and an extensive the presence of similar nucleic acids in samples and identify
contents and an extensive t Note: This sequence is not given in the specification but is based on the human interleukin 17 (IL-17) receptor like protein sequence (AAU09904) and has been created according to information given in claim 24. anti-IL17rlp antibodies and antagonists may also be used to down regulate patients needing restorative therapy. The ILI7rip may also be used as amitges in the production of antibodies against the proteins and in assays to identify modulators of expression and activity rine. expression and activity.

The sequence is PRO20026 which is the human interleukin 17 receptor, IL-17EH4, encoded by DNA 154095-2998. A composition containing ant/agonists to the PRO polypeptides or individual components are useful for treating a mammal with an 'immune related disease, e.g. systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, a spondyloarthropethy, systemic sclerosis, an idiopethic inflammatory myopathy, Sjogren's syndrome, systemic vasculitis, sarcoidosis, autoimmune haemolytic ansemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, contact dermatitis, an altergic disease e.g. food
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel PRO polypeptides homologous to interleukin-17, useful for the diagnosis and treatment of immune related disease e.g. rheumatoid arthritis and diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 10; Fig 18; 188pp; English.

                    hypersensitivity, asthma, a transplantation associated disease, or a chronic inflammatory demyelinating polyneuropathy. Treating a degenerative cartilaginous disorder comprises administering a PRO1031 polypeptide agonic, or antegonist to the mammal. Numerous examples of the diseases and disorders are given in the specification.
                                                                                                                                                                                                                                                                                                                                               292

The invention describes novel nucleic acids encoding interleukin (IL) 17

Treceptor like polypeptides useful as vaccines and in gene therapy. These
have immunoadulatory; anti-inflammatory, anti-diabetic, anti-alzheimer's, renal,
have immunoadulatory; anti-inflammatory, anti-diabetic, anti-alzheimer's, renal,
charlingsonlan, anti-convulsant, anti-asthmatic, dermatological,
anti-parkinsonlan, anti-convulsant, anti-asthmatic, dermatological,
costeopathic, vascular, cytostatic, anti-leukemic, anti-infertility and
proteins may be used to prevent and treat diseases associated with
proteins may be used to prevent and treat diseases associated with
control inappropriate IL-17 receptor like polypeptide (ILI/IL)p) expression. These
include, for example immune disorders (e.g. inflammation, diabetes and
cramsplant rejection), infections (e.g., hepatitis and septicacemia),
weight disorders (e.g. anticetions (e.g., hepatitis and septicacemia),
dysfunction (e.g. Alzheimer's disease, Parkinson's Titsease and epilepsy),
lung disorders (e.g. cystic fibrosis, asthma and emphysema), skin disease
(e.g. eczema and psoriasis), kidney disease (e.g. glomerutonephritis),
bone diseases (e.g. osteoporosis and hypercalcacemia), wasuular disorders
(e.g. stroke and atherosclerosis, cancers (e.g. infertility and
miscarriage), eye disorders (e.g. infertility and
and its complements may also used as diagnostic probes to detect and
cyclemia and the production of similar nucleic acids in samples and identify
patients needing restorative therapy. The III/TIP partipodies and antagonists may also be used as
antigens in the production of antibodies against the proteins and activity. The
contented in the production of similar misconsolope and activity m

subunit (DCRS) polygeptides and the polynuclectides encoding them. The receptors, or their portions may be useful as phosphate labelling enzymes to label mannogens to elicit recognising antibodies, or antigens capable of binding antibodies. A combination, e.g., including a DCRS can be used as an immunogen for the production of antisera or antibodies capable of distinguishing between other cytokine receptor family members. A purified DCRS can also be used as a reagent to detect antibodies generated in response to the presence of elevated levels of expression, or immunological disorders which lead to antibody production to the endogenous receptor. This sequence represents the human DCRS8

to endogenous zcytor18 New cytokine receptor polypeptide designated zcytori8, useful for inhibiting cell proliferation associated with psoriasis or tumor growth, and modulating immune system by binding to endogenous zcyt

47.7

Claim 1; Page 111-115; 119pp; English.

The invention relates to an isolated cytokine receptor polypeptide designated Zcytor18. The Zcytor18 polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit cell proliferation associated with psorialsis or tumour growth. The encoding nucleic acids are useful for providing Zcytor18 in vivo by gene therapy techniques. Zcytor18 oligonucleotide, probes, are useful for in vivo disposis, and the Zcytor18 probes and primers can be used to detect and localize Zcytor18 gene expression in tissue samples. The probes are also useful for detecting gross aberrations in chromosome 3 in which zcytor18 gene resides. The Zcytor18 polymorials in chromosome 3 in which periodic fever and erythroleukemia, and erythroleukemia, associated with pelymorphisms of cytokine receptors. The probes are polymorphisms of cytokine receptors. The probes is associated with mustic and erythroleukemia, associated with murine &cytor18 amino acid sequence

Pred. No. 1s the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Result No.

ILINE. May play a role in controlling the growth and/or differenciation of hematopoletic cells.
OBGELLIATAR ACCATION: Type I membrane protein (1soform 1);
Secreted (1soform 2).

-I- ALTERNATIVE PRODUCTS: 2 1soforms; 1 (shown here) and 2; are produced by alternative splicing.

-I TISSUE SPECIFICITY: Liver and testis. Expressed at lower level in kidney and lung. Expressed in selected T-cell, B-cell and myeloid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -I- MISCELLANDOUS: EVI27 is a common site of retroviral integration in BXH2 murine myeloid leukemias, localized near the ILI7BR gene. Proviral integrations result in increased expression of ILI7BR on

EXERPOR FOR MEMBERS OF THE EPHRIN-B FAMILY. BINDS TO MD. -82.

CTIVITY: ATP + a protein tyrosine - ADP + protein companies.

CLOCATION: Type I membrane protein.

INCLITY: UBIGUITOUS.

CONTAINS 1 FAM DOMAIN.

CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.

BELONGS TO THE TYR FAMILY OF PROTEIN KINASES. EPHRIN

idiopathic inflammatory myopathy; Sjogren's syndrome, systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease; a demyelinating disease, an autoimmune or immune-mediated skin disease; contact dermatitis, an alteriot disease e.g. food thypersensitivity, asthma, a transplantation associated disease, or a chronic inflammatory demyelinating polymeuropathy. Treating a degenerative cartilaginous disorder comprises administering a prolist prolypeptide agoing; or antegonist to the mammal. Numerous examples of the diseases and disorder care given in the specification.

The invention relates to primate and rodent What cytokine receptor submuit (DCRS) polypeptides and the polyuncleotides encoding them. The receptors, or their portions may be useful as phosphate labelling enzymes to label general or specific substrates. The submuits may also be functional immunogens to elicit recognising antibodies, or antigens capable of shidning antibodies. A combination, e.g., including a DCRS can be used as an immunogen for the production of antisers or antibodies apable of distinguishing between other cytokine receptor family members. A purified DCRS can also be used as a reagent to detect antibodies generated in response to the presence of elevated levels of expression, or immunological disorders which lead to antibody production to the endogencial receptor. This sequence represents the human DCRSS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNIPQLCSHLASRDAGLQEPGQHTRQGSRRNYFRSKSGRSLYVAICNMAQFIDEEPDWFE 240

The invention describes novel nucleic acids encoding interleukin (IL) 17 receptor-like polypeptides useful as vaccines and in gene therapy. These have immunomodulatory, anti-inflammartory, anti-diabetic, anti-antener's, renal, anti-parkinsonian, anti-inflammartory, anti-diabetic, anti-infertility and optically anti-covulaint, anti-eachmart, dermatological, costeopathic, vascular; cytostatic, anti-leukaemic, anti-infertility and proteins may be used to prevent and treat diseases associated with proteins may be used to prevent and treat diseases associated with a proteins may be used to prevent and treat diseases associated with a proteins may be used to prevent and treat diseases associated with a proteins any be used to prevent and treat diseases associated with the proteins (e.g. inflammation, diabetes and transplant rejection), infections (e.g. inflammation, diabetes and transplant rejection), infections (e.g. inflammation, diabetes and cransplant rejection), infections (e.g. harkinson's disease and epilepsy), but disorders (e.g. alrohen and obesity), neuronal dystuction (e.g. Alzheimer's disease, Parkinson's disease and epilepsy), but disorders (e.g. cystic fibrosis, asthma and emphysems, asthma and emphysems, asthma and emphysems, and disorders (e.g. growed disorders (e.g. glomerillity and theoremsis), kidey disease (e.g. glomerillity and theoremsis), kidey disease (e.g. glomerillity and theoremsis (e.g. infertility and theoremsis (e.g. infertility and theoremsis may also used as disquostic probes to detect and catagonists may also be used as antigens in the production of antibodies adainst the proteins and interneurs of expression and activity may also be used to down regulate antigened and activity may also be used as antigens in the production of antibodies adainst the proteins and activity may also be used to down regulate antigened and activity and antagonists may also be used to down regulate correllation. ö Nucleic acids encoding interleukin 17 receptor like polypeptides, useful for preventing, diagnosing and treating, e.g. leukaemia, asthma, the invention. 9 - 228.

Note: Residues 1-288 of this sequence correspond to residues 8-296 of sequence shown in AAU10601 which is incomplete in the specification. 1 RKKOOENIYSHLDEESSESTYTAALPRERLRPRPRVFLCYSSKDGONEMNVVQCPAYFL 60 Query Match 100.0%; Score 2210; DB 22; Length 739; Best Local Similarity 100.0%; Pred. New cytokine receptor polypeptide designated zcytori8, useful for inhibiting cell proliferation associated with psoriasis or tumor growth, and modulating immune system by binding to endogenous zcytori8 Claim 1; Page 102-106; 119pp; English.

The invention relates to an isolated cytokine receptor polypeptide designated Scytoria. The Scytoria polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit cell proliferation associated with psoriasis or tumour growth. The encoding nucleic soids are useful for providing Scytoria in vivo by gene therapy techniques. Ecytoria oligomucleictide probes are useful for in vivo diagnosis, and the Scytoria probes and primers can be used to detect and localize Ecytoria gene expression in tissue asmiples. The probes are also useful for detecting gross aberrations in chromosome 3 in which Scytoria gene resides. The Scytoria polypurcleotides can also be used in

```
linkage-based testing of pulmonary alveolar proteinosis, familial periodic fever and erythroleukemia, and erythroleukemia associated with polymorphisms of cytokine receptors. The present sequence represents a human Zcytori8 splice variant.

The invention relates to an isolated cytokine receptor polypeptide...

Casignated Ecytoris The Ecytoris polypeptides can be expressed by the standard recembinant methodology. The polypeptides can be used to inhibit coil proliferation associated with postiasis or tumour.growth. The groot cell proliferation associated with postiasis or tumour.growth. The groot cell proliferation associated with postiasis or tumour.growth. The groot cell proliferation associated with providing Ecytoris in vivo by gene therapy techniques. Ecytoris oligonolectide probes are used to detect and localize Ecytoris probes and primers can be used to detect and localize Ecytoris probes and primers can be used to detect and localize Ecytoris gross aberrations. The probes are also useful for detecting gross aberrations. The horizonesome is in which, and localize fewer and ecytoris polymoriol@tides can also be used in linkage; based testing of pulmonary alveolar proteinosis, familial and polymorphisms of cytokine receptors. The present sequence represents a human Ecytoris and organized with

designated & Cytor18. The zeytor18 polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit estandard recombinant methodology. The polypeptides can be used to inhibit cell proliferation associated with psorlasis or tumour growth. The encoding nucleic acids are useful for providing Ecytor18 in vivo by gene therapy techniques. Ecytor18 oilgonucleotide probes are useful for in vivo diagnosis, and the "zcytor18 probes and primars can be used to detect and localize Ecytor18 gene expression in tissue samples. The probes are also useful for detecting gross aberrations in chromosome 3 in which

New cytokine receptor polypeptide designated zcytor18, useful for inhibiting cell proliferation associated with psoriasis or tumor growth, and modulating immune system by binding to endogenous zcytor18

Ecytoris gene resides. The Ecytoris polynucleotides can also be used in linkage-based testing of pulmonary alveolar proteinosis, familial periodic fever and erythroleukemia, and erythroleukemia associated with polymorphisms of cytokine receptors. The present sequence represents a human Ecytoris variant amino acid sequence:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RGSGKGELFLVAVSAIAEKLRQAKQSSSAALSKFIAVYFDYSCEGDVPGILDLSTKYRLM 180

Nucleic acids encoding interleukin 17 receptor like polypeptides, useful for preventing, diagnosing and treating, e.g. leukemia, asthma, diabetes, psoriasis and glaucoma

Claim 2; Page 152-154; 158pp; English.

The invention describes novel nucleic acids encoding interleukin (IL) 17 receptor like polypeptides useful as vaccines and in gene therapy. These have immunomodulatory, anti-inflammatory, anti-diabetic, anti-alzheimer's, renal, anti-parkinsonian, anti-convulsant, anti-asthmatic, dermatological, costeopathic, vascular, cytostatic, anti-straming anti-infertility and optibal mological activities The IL-17 receptor like nucleic acids and proteins may be used to prevent and treat diseases associated with circulde, for example immune disorders (e.g. inflammation, diabetes, and transplant rejection), infections (e.g. hepatitis and septicaemia), we wight disorders (e.g. antimared), and obesity), neuronal cyfunction (e.g. Alzheimer's disease, parkinson's disease and emphysema), extendidanders (e.g. cystic fibrosis, asthma and camphysema), extin disease (e.g. eczema and psoriatis), kidney disease (e.g. glomerulonephritis), condiseases (e.g. serioders (e.g. eczema and psoriatis), kidney disease (e.g. glomerulonephritis), condiseases (e.g. serioders), reproductive disorders (e.g. effective), missioners, condiseases (e.g. disease), and hypercalcaemia), vascular disorders (e.g. stroke and atheroscierosis, cancers (e.g. infermia, myeloma and characters), resproductive disorders (e.g. infermia, myeloma and construction. anti-III]7rlp antibodies and antagonists may also be used to down regulate expression and activity. This is the amino acid sequence of the human miscarriage), eye disorders (e.g. glaucoma and retinal neuropathy). The DNA and its complements may also used as diagnostic probes to detect and quantitate the presence of similar nucleic acids in samples and identify patients needing restorative therapy. The ILI/IIp may also be used as antigens in the production of antibodies against the proteins and in assays to identify modulators of expression and activity. The

Nucleic acids encoding interleukin 17 receptor like polypeptides, useful for preventing, diagnosing and treating, e.g. leukemia, asthma, diabetes, psoriasis and glaucoma

Claim 18; Page -; 158pp; English.

The invention describes novel nucleic acids encoding interleutin (IL) 17 ceceptor like polypeptides useful as vaccines and in gene therapy. These have immunomedulatory, anti-inflammatory, and inflammatory, and inflammatory, and inflammatory, and include, for example immune disorders (e.g., harbatharia and septicaemia), include, for example immune disorders (e.g., napratory), and appropriate Ti-inflammatory, and inflammatory, and and disorders (e.g., ancreais, asthma and obesity), neuronal or weight disorders (e.g., ancreais, asthma and obesity), neuronal or equilibrial and phypercal campais, and phypercal campais, and appropriates (e.g., ancreais, and hypercal campais, and appropriates (e.g., ancreais, cancers (e.g., glaucoma and policibrial), kidney disease (e.g., glaucoma and appropriate disorders (e.g., qlaucoma and retinal neuropathy). The observation expension of anti-inflammatory and infarility and edect and quantitate the presence of similar uncleic acids in samples and indentify andilators of expression and activity. The anti-orders and antaponiates may also be used as anti-inflammatory and anti-inflammatory and anti-inflammatory and anti-inflammatory and anti-inflammatory. The complements of expression and activity and anti-inflammatory and anti-inflammatory and anti-inflammatory and anti-inflammatory. The anti-inflammatory and anti-inflammatory and anti-inflammatory and anti-inflammatory and anti-inflammatory. The anti-inflammatory and anti-inflammatory and anti-inflammatory and anti-inflammatory and anti-inflammatory. The anti-inflammatory and anti-inflammatory and anti-inflammatory and anti-inflammatory and anti-inflammatory. the Note: This sequence is not given in the specification but is based on thuman interleukin 17 (IL-17) receptor like protein sequence (AAU09904) and has been created according to information given in claim 18.

Nucleic acids encoding interleukin 17 receptor like polypeptides, useful for preventing, diagnosing and treating, e.g. leukemia, asthma, diabetes, psoriasis and glaucoma

Claim 21; Page -; 158pp; English.

The invention describes novel nucleic acids encoding interleukin (IL) 17 receptor like polypeptides useful as vaccines and in gene therapy. Those receptor like polypeptides useful as vaccines and in gene therapy. Those have immunomodulatory, anti-inflammatory, anti-diabetic, anti-alzheimer's, renal, anti-parkinsonian, anti-convulsant, anti-asthmatic, dermatological, costeopathic, vascular, cytostatic, anti-leukemic, anti-infertility and optibal mological activities. The IL-17 receptor like nucleic acids and proteins may be used to prevent and treat diseases associated with inappropriate IL-17 receptor like polypeptide (IL17rip) expression. These include, for example immune disorders (e.g. inflammation, diabetes and remappath rejection) infections (e.g. hepatitis and septicemia), weight disorders (e.g. anorexia, cacheais and obesity), neuronal cystuction (e.g. Alzheimer's disease, parkinson's disease and epilepsy), uny disorders (e.g. cystic fibrosis, asthma and emphysema), skin disease (e.g. ecrema and psoriasis), kidney disease (e.g. glomerulonephritis), bone diseases (e.g. osteoporosis and hypercalcaemia), vascular disorders (e.g. stroke and atherosclerosis, cancers (e.g. leukemia, myeloma and

breast cancer), reproductive disorders (e.g. Infertility and miscarriage), eye disorders (e.g. glaucoma and retinal neuropathy). The DNA and its complements may also used as disquistic probes to detect and quantitate the presence of similar nucleic acids in samples and identify patients needing restorative therapy. The ILI7rip may also be used as mitigans in the production of antibodies against the proteins and in assays to identify modulators of expression and activity. The anti-ILI7rip antibodies and antagonists may also be used to down regulate Note: This sequence is not given in the specification but is based on thuman interleukin 17 (IL-17) receptor like protein sequence (AAU09904) and has been created according to information given in claim 21. The invention describes novel nucleic acids encoding interleukin (IL) 17
receptor like polypeptides useful as vaccines and in gene therapy. These
receptor like polypeptides useful as vaccines and in gene therapy. These
have immunosuppressive, hepatic, anabolic, anti-diabetic, anti-alzheimer's, renal,
that in the polypeptide anti-convulsant, anti-asthmatic, dermatological,
costeopathic, vascular, cytostatic, anti-leukemic, anti-infertility and
optibalmological activities. The IL-17 receptor like nucleic acids and
proteins may be used to prevent and treat diseases associated with
proteins may be used to prevent and treat diseases associated with
contains may be used to prevent and treat diseases associated with
propriate IL-17 receptor like polypeptide (IL)Thip) expression. These
include, for example immune disorders (e.g. infilammation, diabetes and
transplant rejection), infections (e.g. infilammation, diabetes and
cransplant rejection), infections (e.g. infilammation), altherance
dysfunction (e.g. Alzheimer's disease, Parkinson's disease and epilepsy),
cone diseases (e.g. cystic fibrosis, asthma and emphysemal, skin disease
(e.g. eczema and psoriasis), kindery disease (e.g. glomerulonephritis),
bone diseases (e.g. osteoporosis and hypercalcaemia), vascular disorders
(e.g. stroke and atherosolerosis, cancers (e.g. infertility and
miscarriage), eye disorders (e.g. glaucoma and retinal neuropathy). The
Drast cancer), reproductive disorders (e.g. infertility and
miscarriage), eye disorders (e.g. glaucoma and retinal neuropathy). The
Drast cancery, reproductive disorders (e.g. infertility and

New cytokine receptor polypeptide designated zcytori8, useful for inhibiting cell proliferation associated with psoriasis or tumor growth, and modulating immune system by binding to endogenous zcytori8 ligand.

Claim 1; Page 111-115; 119pp; English.

The invention relates to an isolated cytokine receptor polypeptide designated zcytoris. The Zcytoris polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit cell proliferation associated with psoriasis or tumour growth. The encoding nucleic acids are useful for providing Zcytoris in vivo by gene therapy techniques. Zcytoris oligonucleotide probes are useful for in vivo disponsis, and the Zcytoris probes and primars can be used to detect and localize Zcytoris gene expression in tissue samples. The probes are also useful for detecting gross aberrations in chromosome 3 in which Zcytoris gene resides. The Zcytoris polypucicotides can also be used in linkage-based testing of pulmonary, alveolar proteinosis, familial periodic fever and erythrolukemia, and erythroleukemia associated with murins zone of cytokine receptors. The present sequence represents a murins zone. murine Zcytor18 amino acid sequence
